Software Measurement: The Art, The Science, and The State of the Practice

PSM Conference July 2007

Some of Dan's Heroes Throughout Time

- **Frederick Taylor:** The Principals of Scientific Management 1901 "Let data and facts do the talking"
- **W. Edwards Demming:** "In God We Trust... All Others Bring Data"
- **Frederick Brooks:** "There is an incremental person when added to a software project that makes it take longer"
- **Ed Yourdon:** "Avoiding Death Marches in Software Projects"
- **Steven Covey:** "Sharpen the Saw" Focus on improvement

Frederick
Taylor

"In God we trust,
all others bring data."

- W. Edwards Deming

Information Based Project Management

Project Management Defined

- Application of knowledge, skills, tools, and techniques to project activities in order to meet or exceed stakeholder needs and expectations from a project
- Management Functions
 - Planning
 - Organizing
 - Staffing
 - Directing
 - Controlling
- All are enhanced by measurement

Top Management Directive "Run IT like a Business"

\$255 billion spent on IT projects

- 53% challenged
- 18% failed
- 29% successful

2005 Cutter Consortium software project survey reported:

- 62% overran original schedule by more than 50%
- 64% more than 50% over budget;
- 70% had critical product quality defects after release

Standish Group, Chaos Report,
2004 Third Quarter findings

\$55 billion of U.S. IT budgets wasted annually
Averages 22% of IT organizations budget

People, Process, Technology Are Keys Source CMMI Tutorial

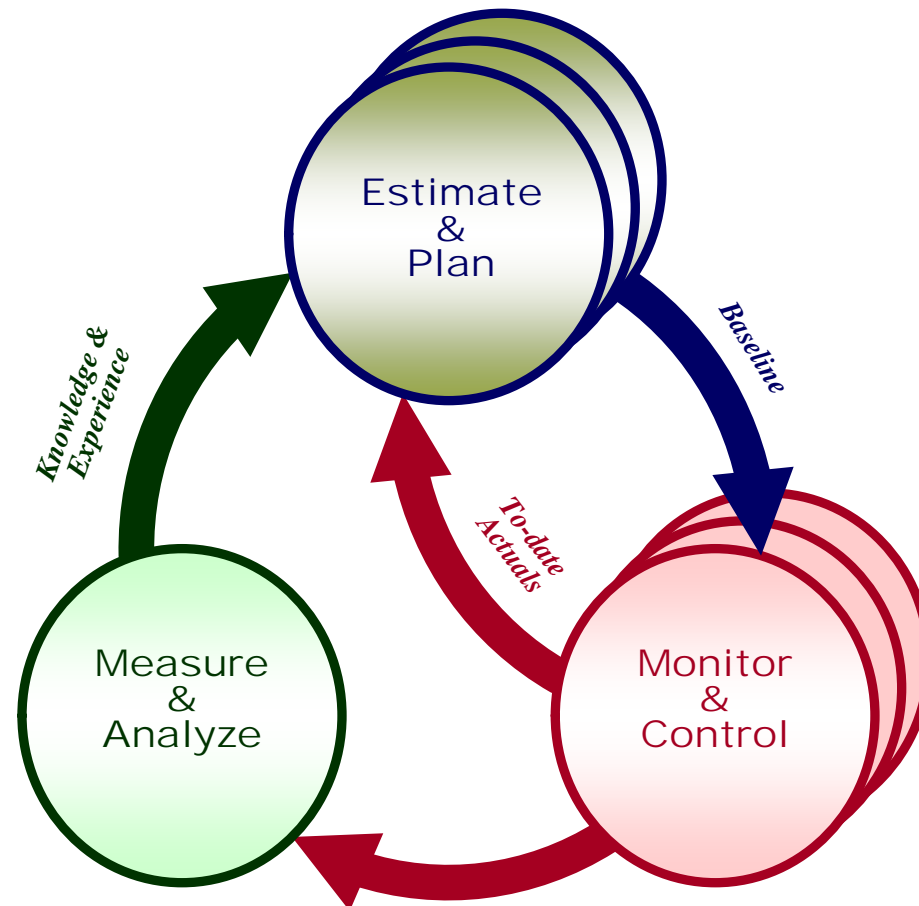

- Everyone realizes the importance of having a motivated, quality work force but...
- ...even our finest people can't perform at their best when the process is not understood or operating "at its best"
- Change software from idiosyncratic to normative
 - We can use industry lessons instead of learning all on our own

Major determinants of product cost, schedule, and quality

CMMI Process Areas Supported By Estimation, Planning & Control

Quantitative Project Management

A Foundation of Risk Management

Learning From Lean Manufacturing

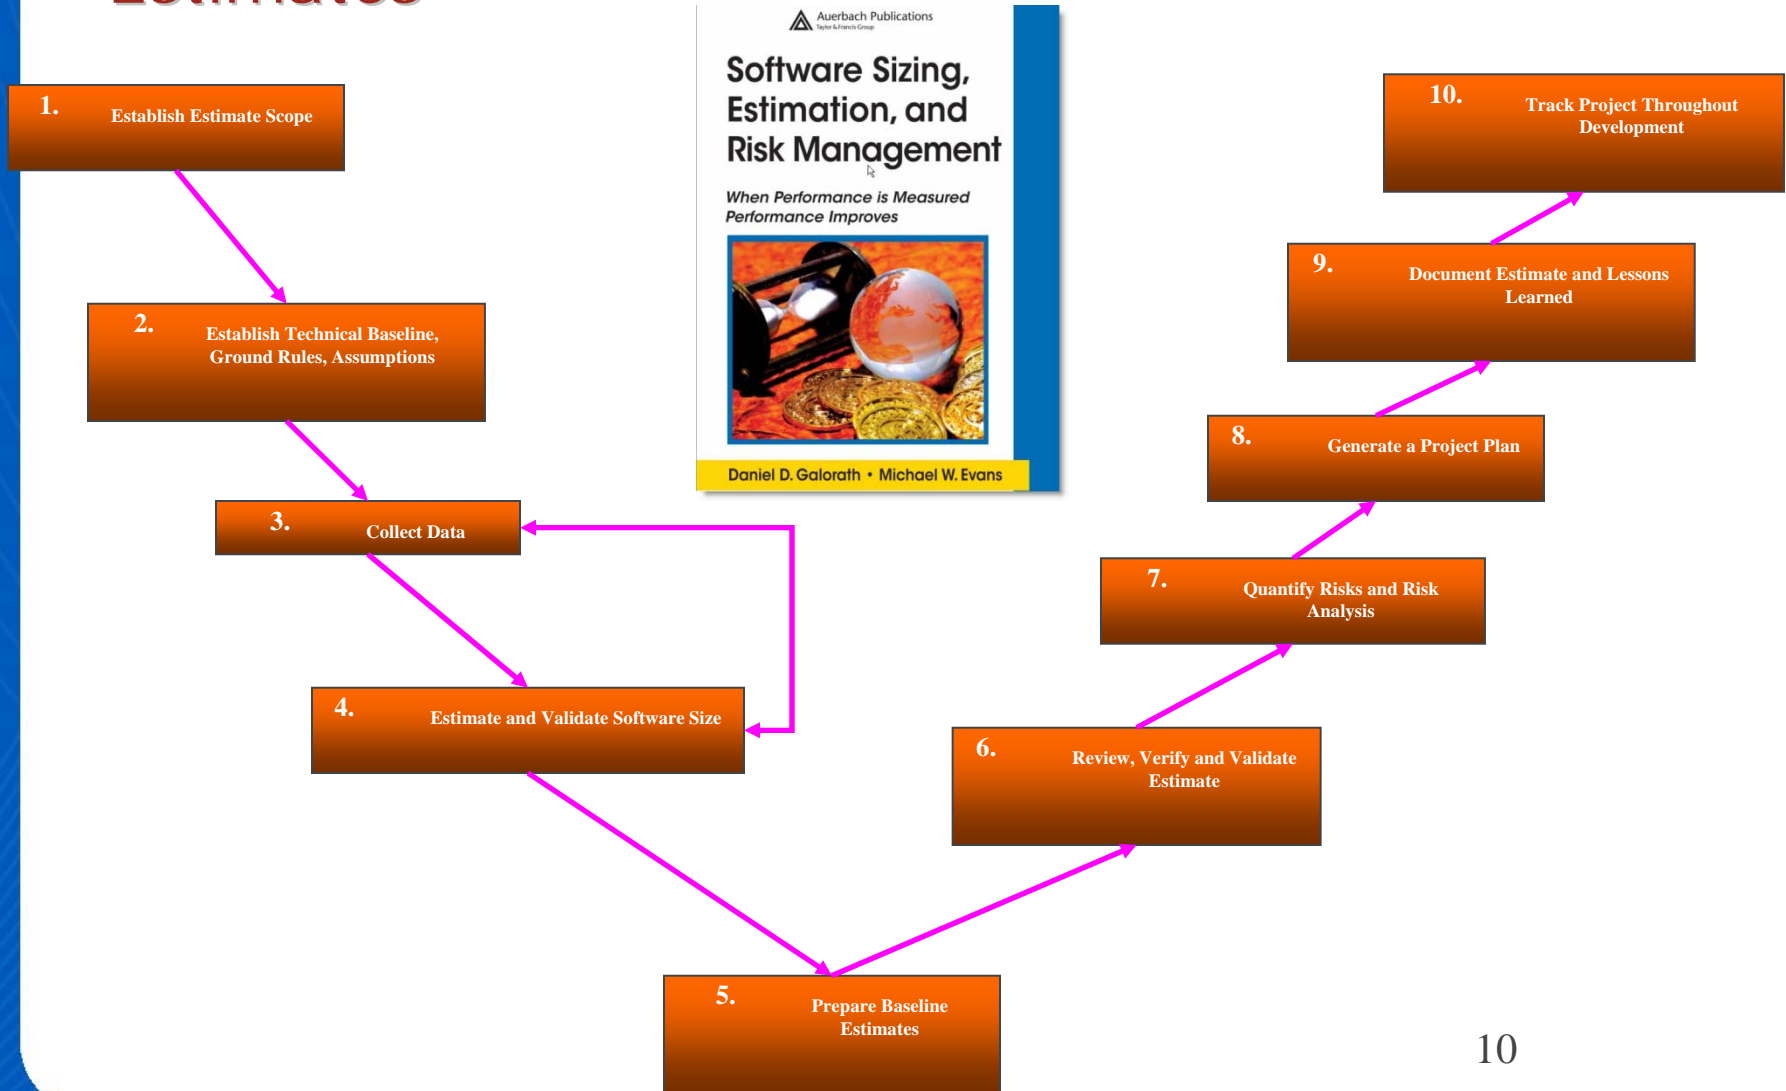

- **Craft production:** The individual is supreme
- **Mass Production:** The system is supreme
 - Minimize cost by max resource utilization
 - Principals: Efficiency; repeatability; large infrastructures; Technocentrism
 - Software currently at mass production level
- **Lean Production:** Integrate System and People
 - Superoptimization, flexibility, maximize value; minimize waste
 - Principals: Value, flow, pull, perfection

Mindset: Product & Stakeholder, Then Process

- “The concentration should be on the product, not just the process”
- Total Quality Management (TQM) advocates claim, process quality determines product quality but...
 - Unless one has a clear definition and expectation for the product, the process is ineffective
 - Analogous to the Chinese proverb...“If you don’t know where you want to go, a map is useless.”
- Deming's...ideas...being overlooked
 - What is it that we want to accomplish?
 - What are the useful products of the endeavor?
 - How will it benefit the stakeholders?”
- Source: (Baker, Defense Acquisition Univ.; Michel, National Defense Univ.“Education, Information Technology, and the "Software Crisis" " April 2002)

10 Step Software Estimation Process: Consistent Processes = Reliable Estimates

PSM Integrated Software Management 1998

Measurement & Data Collection

Goal Question Metric Approach

- Combine goal-orientation bottoms up, decision-support & other operational management techniques
 - www.weather.com to decide to bring an umbrella is decision support

Reasons Many Don't Want To Provide Data

- They could be proven wrong
- It could be used against them
- Data often doesn't exist
 - Even if processes dictate data requirements
- If it exists it may not be clean
- It may give away corporate productivity & bid strategy

Data Must Be Used With Caution

- Run sanity checks on data
 - A million lines of code can't be developed in 3 months
- Ongoing issue between our statisticians and engineers
- Some Statisticians claim.. "That is what the data says so it must be right"
 - Sometimes even if it is obviously wrong

Josiah Stamp Observation On Data & Statistics

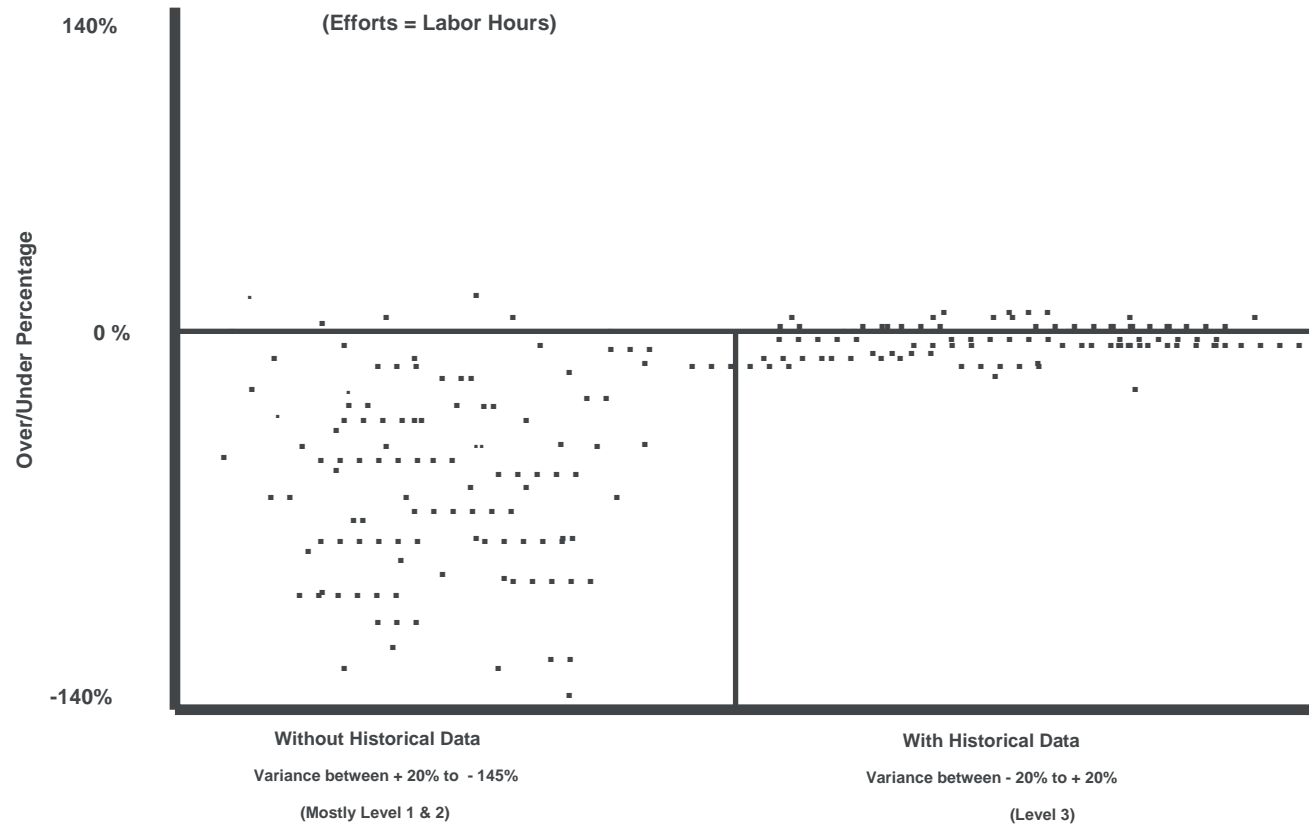

- “The government [is] extremely fond of amassing great quantities of statistics. These are raised to the nth degree, the cube roots are extracted, and the results are arranged into elaborate and impressive displays.
- What must be kept ever in mind, however, is that **in every case, the figures are first put down by a village watchman, and he puts down anything he d..m well pleases.**
- Attributed to Sir Josiah Stamp, 1840-1941, H.M. collector of inland revenue.

Data Improves Estimates For New Programs

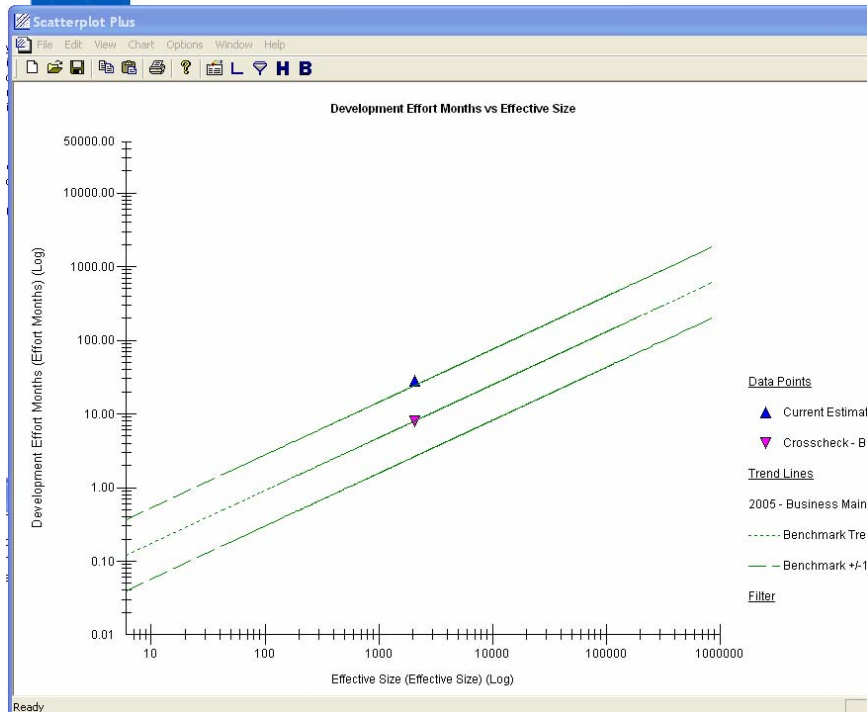

Source: John Vu, Boeing SEPG 1997

John Vu, Boeing, keynote talk at SEPG '97,
"Software Process Improvement Journey (From Level 1 to Level 5)"

(Based on 120 projects in
Boeing Information Systems)

Historical Data Can Substantiate Parametrics and/or Provide Calibration

ProjectMiner Report

ProjectMiner Processing Report

Current Mode: Crosscheck

	ProjectMiner Estimate -2 sigma	ProjectMiner Estimate -1 sigma	ProjectMiner Estimate Mean	ProjectMiner Estimate +1 sigma	ProjectMiner Estimate +2 sigma
Effort:	0.84	2.60	8.10	25.17	78.23
Schedule:	2.87	4.18	6.10	8.91	13.00
SEER-SEM Solution Space Effort	Low		High		
	11.45		51.93		

Input Summary

Effective Size: 2074

ProjectMiner Options

Activate ProjectMiner

Modes:

- Crosscheck Mode (Recommended). Use this mode to crosscheck your SEER-SEM estimate. This mode does not change your SEER-SEM estimate. The ProjectMiner estimate will appear only on the ProjectMiner report.
- Calibrated Mode. Use this mode when you want to calibrate your SEER-SEM estimate to the ProjectMiner estimate and want to evaluate the impact of changing SEER-SEM parameters. This mode will change your SEER-SEM estimate so that it is calibrated to the ProjectMiner estimate. With this mode, you will be able to see the impacts of SEER-SEM parameters against your ProjectMiner based estimate.
- Replacement Mode. Use this mode when you want to replace your SEER-SEM estimate with the ProjectMiner estimate. In all parts of SEER-SEM, the ProjectMiner estimate will be shown. The estimate will change only if a different Platform or Application knowledge base is loaded or the size is modified.

OK Cancel Help

Data Collection Lessons Learned (Summarized)

1. Motivate potential data providers to participate
2. Avoid nondisclosure agreements containing clauses requiring exclusivity or destruction of data if you can
3. Provide data collection forms and instructions beforehand, in both hard copy and electronic formats
4. Provide clear definitions but recognize providers may not read them
5. Identify which data are *required, highly desirable* or *desirable*
6. During the face-to-face interview confirm data is realistic and valid
7. Grade to indicate confidence
8. Normalize data via well-documented process & keep both the raw and normalized data

Cost Management... 1998 Cost Conference
Dan Keynote Air Force Aeronautical
Systems Center REDUX

Who Cares About Costs??!!

REDUX

- "Affordability Driving New Weapon System Designs" Aviation Week 9/7/98
- "Operators Push For Cuts In Cost Of Composites Use" Aviation Week 9/7/98
- "Cost of New Space Station 3.6 Billion Over Budget", Los Angeles Times 1998
- "A Day Late and (Many) A Dollar Short" The Hackett Group
- "For Every 100 Application Development Projects There Are 94 Restarts", Computerworld Magazine
- "Behind Oxfords Billing Nightmare" Business Week 11/17/97
- "Feds Year 2000 Costs On Rise" Computerworld Magazine 9/7/98
- ...And On And On

Since Costs Are Constantly Talked About Why Aren't They Understood and Managed?

- Don't Know How
 - How To Produce Credible Estimates
 - How To Scope The Problem
 - How To Factor In Risk
- Engineers Sometimes Don't Care
 - Make It "Best"... At Any Cost
 - Since They Can't Quantify Cost They Often Ignore Cost
- Government Sometimes Monitors Rather Than Manages
- Over Optimism
- Sometimes People Don't Want To Know The Cost

Frederick Brooks Classic Paper “No Silver Bullets”

- “There is no single development, in either technology or management technique, which by itself promises even one order-of magnitude improvement within a decade in productivity, in reliability, in simplicity.”
- -- Fred Brooks, 1986
- i.e. There is no magical cure for the “software crisis”
 - Not software measurement
 - Not better tools
 - Not ---- (fill in the blank... the current great hope)

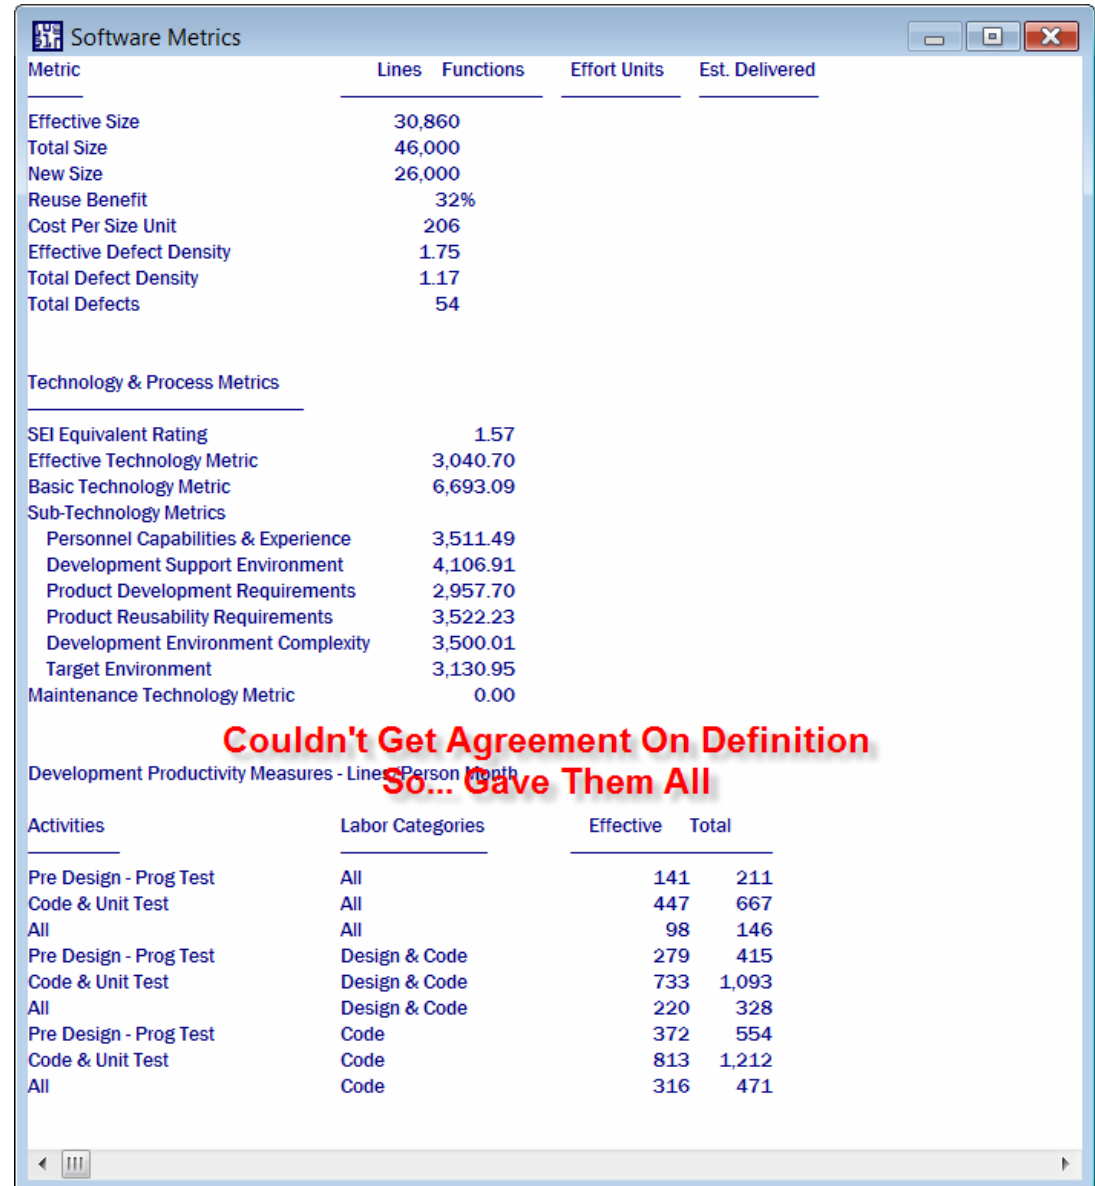

Evolution of Size Metrics as an Example

Evolution of Size Measures

- Where lines of code was once the king
 - In many domains other measures are gaining overtaking them
- Where code used to be hand generated and easily counted with counters..
 - Much code is autogenerated
 - And many systems are primarily legacy
 - Or package installation

Even With Standards Many Use Their Unique Definitions

- Tried to establish single definition for productivity
- Unsuccessful so we gave all possible definitions
- Advantage: all are there
- Disadvantage: Even ones you don't need/want are there

Software Metrics

Metric	Lines	Functions	Effort Units	Est. Delivered
Effective Size	30,860			
Total Size	46,000			
New Size	26,000			
Reuse Benefit	32%			
Cost Per Size Unit	206			
Effective Defect Density	1.75			
Total Defect Density	1.17			
Total Defects	54			

Technology & Process Metrics

SEI Equivalent Rating	1.57
Effective Technology Metric	3,040.70
Basic Technology Metric	6,693.09

Sub-Technology Metrics

Personnel Capabilities & Experience	3,511.49
Development Support Environment	4,106.91
Product Development Requirements	2,957.70
Product Reusability Requirements	3,522.23
Development Environment Complexity	3,500.01
Target Environment	3,130.95
Maintenance Technology Metric	0.00

Development Productivity Measures - Lines/Person Month

Activities	Labor Categories	Effective	Total
Pre Design - Prog Test	All	141	211
Code & Unit Test	All	447	667
All	All	98	146
Pre Design - Prog Test	Design & Code	279	415
Code & Unit Test	Design & Code	733	1,093
All	Design & Code	220	328
Pre Design - Prog Test	Code	372	554
Code & Unit Test	Code	813	1,212
All	Code	316	471

Couldn't Get Agreement On Definition
So... Gave Them All

Size Mis-Estimation Then and Now

- Where size has often been miscounted or misestimated
- Function based sizing methods have the same issues
 - “Physical Function Points” Versus IFPUG
 - COSMIC Versus ...
 - Full Function Points Versus...
- The problem of definition

Projects have been killed because the program office was not happy with the count.. Compared to another system's count with different version of function points

Industry Databases

The Good

- databases are available e.g:
 - ISBGS
 - NASA SEL
 - SSCAG
 - New efforts with SEI and others
 - Others

The Bad

- Data is as good as the recorder
- Data may not be normalized
- Some data is structured to impress
- Some are trying to just consolidate..
Buyer be ware

Thoughts On Measurement

Source: J. Rothman

- Measurement Is Observation
- Measure what makes sense
- Measure what you want more of
- DeMarco: Effort moves to what is measured
- Measure in the aggregate
- Be careful measuring individuals

Measurement Is One Key To Controlling Chaos Projects

- Identify the “meatballs in the spaghetti”.. What we will measure
- Capture & document these units of software
- Clarify subdivisions of work & definitions of “complete”
 - Include reviews as part of complete
- Quickly train team on these processes
- Invoke peer reviews to reduce errors and increase reliability
- Measure and track progress vs effort
- Spend management time where measurement shows issues

Functional Focus Example: Ladies Purse

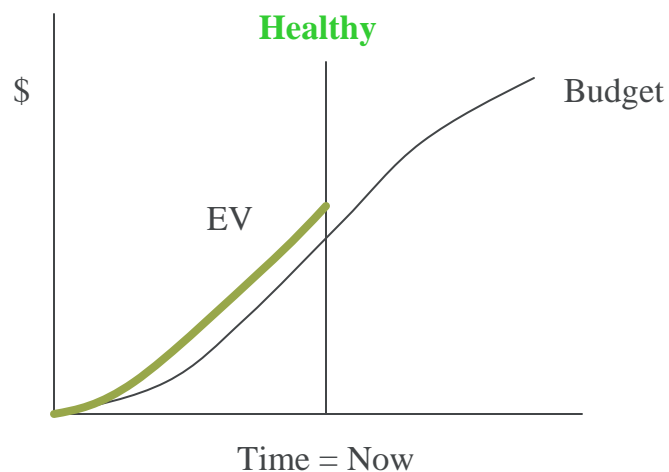

- Function Hold stuff
- Cost..... \$400 at Nordstrom
- What else will perform the function?.....Paper bag - cost = \$0.05
- Go to plastic bag for more durability.....Cost = \$0.10
- Add color.....Cost = \$0.15
- Add strap.....Cost = \$0.25

Earned Value

Use Earned Value TO Quantify Progress Versus Effort

- Main concern of EVM: what has been accomplished in a given time and budget, versus what was planned for the same time and budget
 - A project is generally healthy if what has been accomplished is what was planned, or more
 - Project unhealthy if accomplishment lags expectations
- Definition: Earned value = budgeted value for the work accomplished (what you got for what it cost you)

Defects and Growth Impact Software Process

Health and Status Indicator shows status and trends from the previous snapshot
Thresholds are user definable

Increased defect reporting rate shows a worsening trend

The 'Health & Status Indicator' dashboard displays a grid of metrics for 'Analyst Support Sy...'. The metrics are: Schedule Variance (BETTER), Time Variance (BETTER), Cost Variance (WORSE), Size Growth (BETTER), and Defects (WORSE). The 'Defects' metric is highlighted in red, indicating a negative status.

Metric	Status
Schedule Variance	BETTER
Time Variance	BETTER
Cost Variance	WORSE
Size Growth	BETTER
Defects	WORSE

The Hawthorne Effect: People Respond To Being Measured

- Goal: Find optimum for productivity 1924 to 1927
- **Increase, No Control Group**; Three departments; all showed an increase of productivity, whether illumination increased or decreased.
- **Increase, Control group** = change in lighting; experimental group got sequence of increasing light. Both groups substantially increased production, no difference between groups
- **Decrease, Control group got stable lights**; other sequence of decreasing levels. Both groups steadily increased production until the light in experimental group got so low they protested and production fell off
- All back to original: Productivity went up

Six Sigma Lessons For Measurement (Source DR. RICK EDGEMAN)

Define the problem and customer requirements.

Measure defect rates and document the process in its current incarnation.

Analyze process data and determine the capability of the process.

Improve the process and remove defect causes.

Control process performance and ensure that defects do not recur.

Six Sigma Can Be A Model For Measurement

highly structured strategy for acquiring, assessing, and applying customer, competitor, and enterprise intelligence for the purposes of product, system or enterprise innovation and design

Innovation Algorithm

DMAIC (Define-Measure-Analyze-Improve-Control)

Design for Six Sigma Algorithm

DMADV (Define-Measure-Analyze-Design-Verify)

- Applies strategies & tools from Statistics, Quality, Business, Engineering and other disciplines

Six Sigma application
can improve both estimates and estimate process

Fundamental Metrics For Estimation, Planning & Control

- Size

- AKA Volume, Mass
- Units: Source Lines of Code (SLOC); Function Points (FP) Use Cases
- New versus rework
- COTS & Packages

- Effective Technology

- AKA Productivity Potential, Efficiency
- Units: none

- Time

- AKA Duration, Schedule
- Units: Calendar Months, Calendar Weeks

- Effort

- AKA Work, Labor
- Units: Staff Months, Staff Hours

- Cost

- AKA Budget, Money
- Units: \$, other currencies

- Staffing

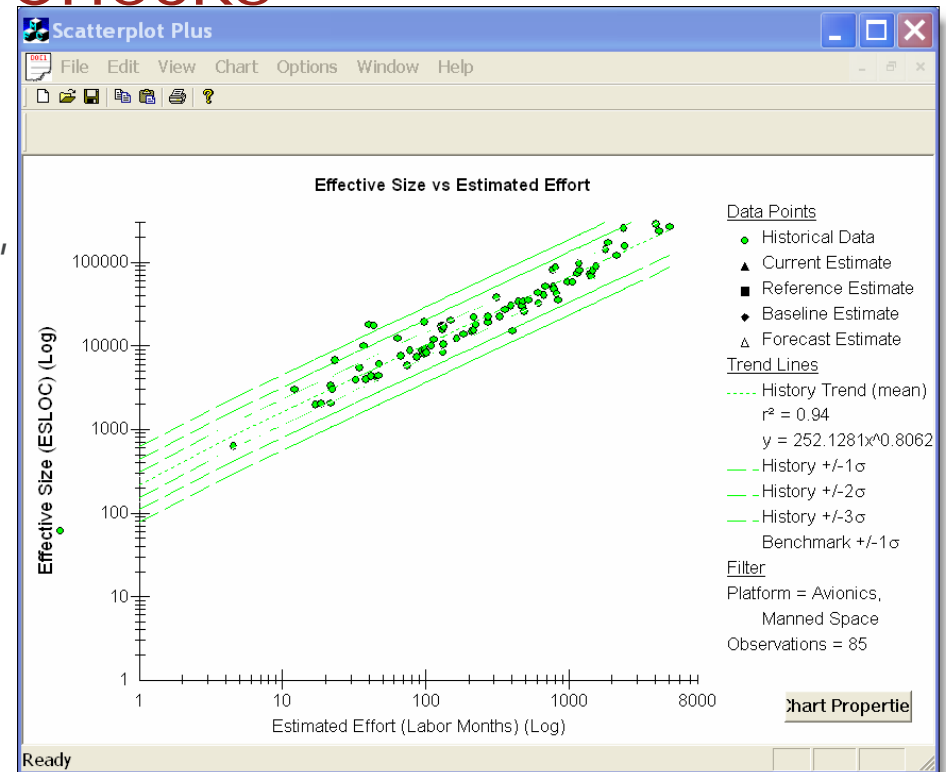

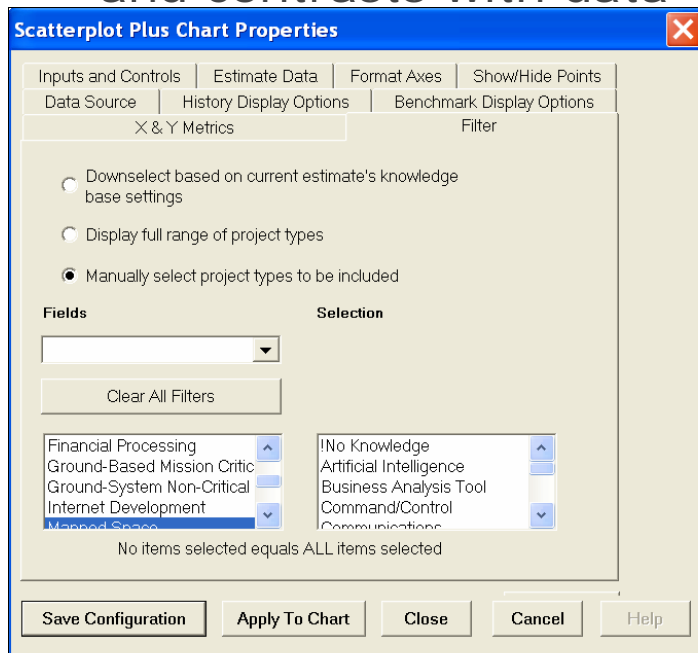

- AKA Manpower Loading
- Units: FTE People

- Defects

- AKA Reliability, Quality
- Units: Defect Count

Compare Parametrics With Metrics and Sanity Checks

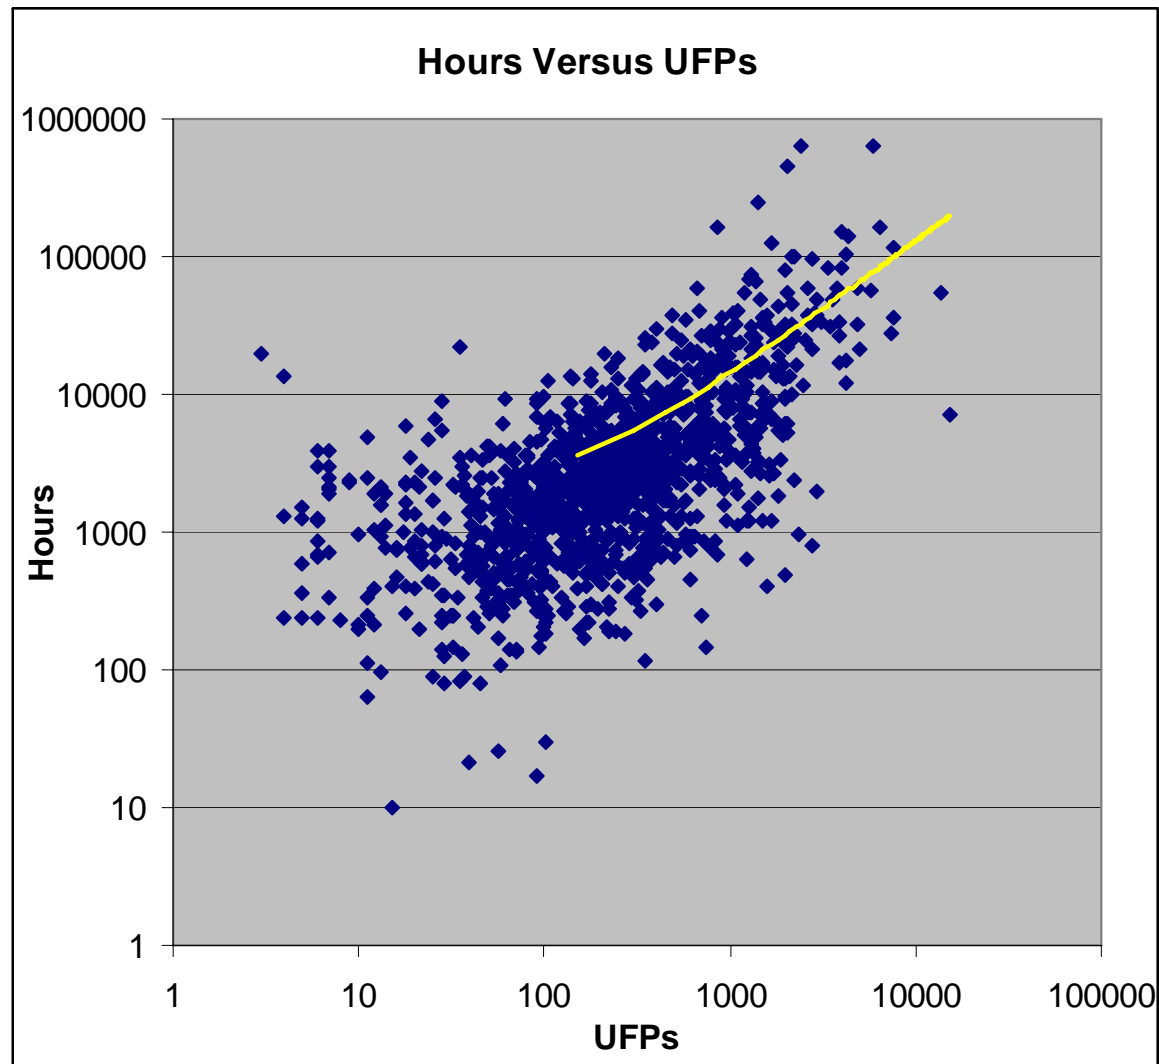

- Works with common repository
- Shows actual data, ranges, and correlations
- Plots SEER-SEM estimates and contrasts with data

"In God we trust,
all others bring data."

- W. Edwards Deming

Just the Top Level Data Isn't Sufficient For Estimation

The 7 Habits Of Highly Effective Measurement Adapted From: Covey

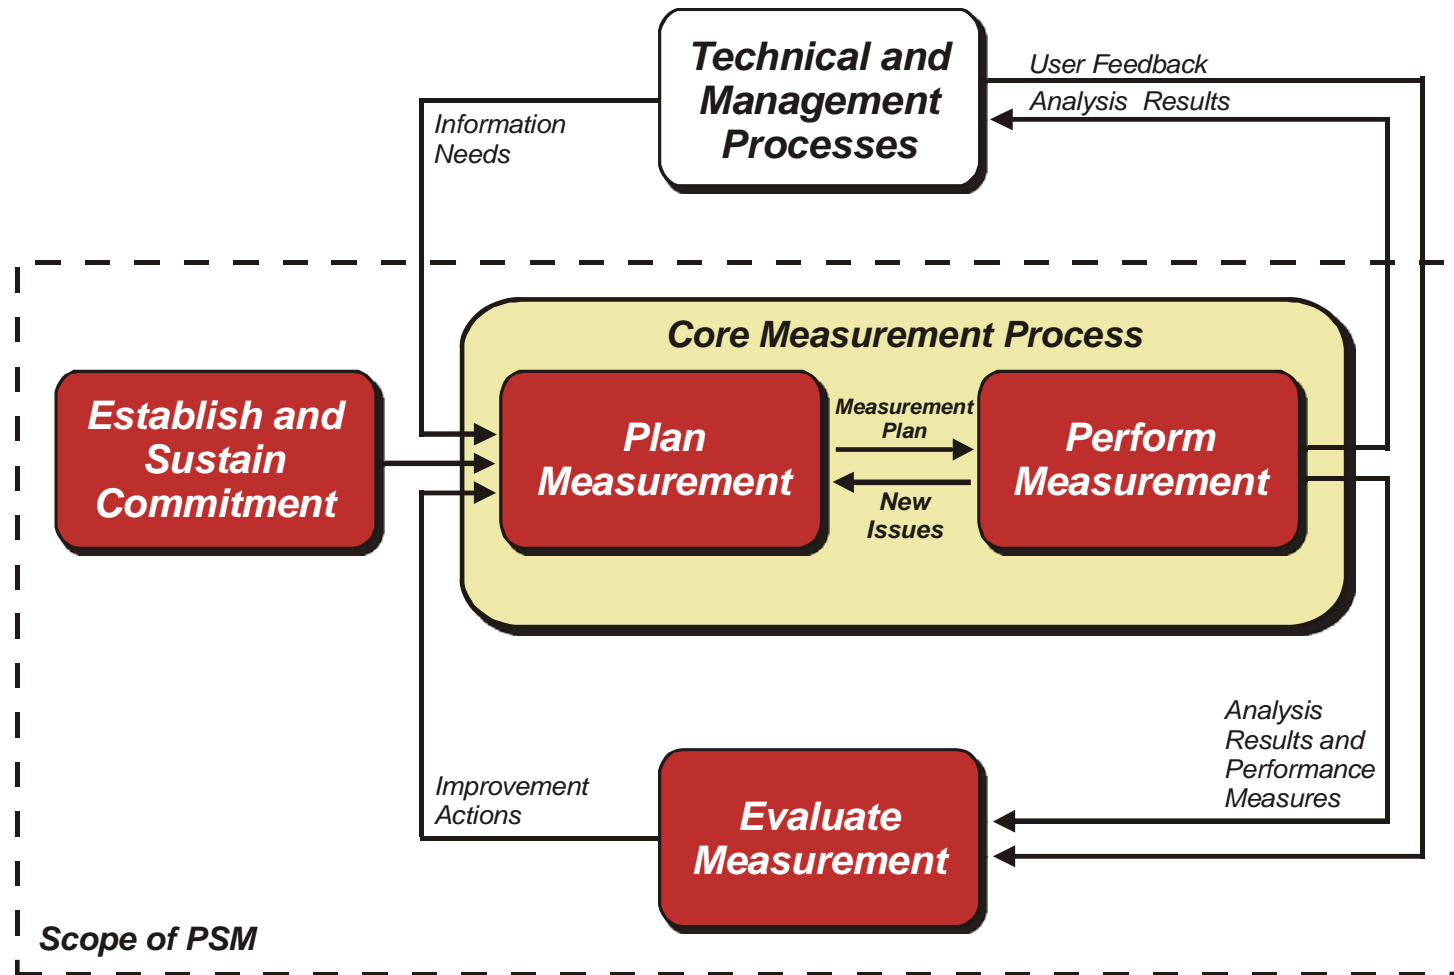

- Be Proactive: Identify Targets, Find Ways Of Meeting Conflicting Goals
- Begin With the End In Mind: Understand What the Key Issues Are.. Measure what matters
- Put First Things First: Planning
- Think Win/ Win: Ensure measurement helps those being measured
- Seek First to Understand, Then to be Understood
- Synergize: Combine Knowledge/Resources /data With Models & processes
- Sharpen the Saw: Spend Some Resources To Improve Processes & Tools, Training

PSM 2007

Follows the 7 Habits

The Rule of Inertia

If you always do
what you always do
then
you will always get
what you always get

The Rule of Measurement

When performance is measured
Performance improves...

When performance is measured and
reported the rate of improvement
accelerates..

Thomas Monson

Conclusions

- Applied measurement is a critical component of software and systems management
- Measure what you want people to focus on
- Continue emphasis on standards and definition
- Data collection is challenging
- Additional emphasis on data validation
